STORYBOARD · FRAME BY FRAME · v1

# Agentic AI: Showing the evidence behind a decision

Explainer video · Script 3 · 16:9, 1920×1080 · approx. 3:03 · 19 scenes

Draft for client review · 14 Nov 2026

# Look & feel

### VISUAL DIRECTION

Dark, premium SaaS look in the style of the benchmark: deep navy/black stage, soft TG Blue light blooms, frosted-glass UI panels tilted in 3D space, product-style screens instead of characters. The graph itself is the hero: glowing nodes and connectors that light up step by step.

### MOTION LANGUAGE

Smooth eased camera moves (push-ins, parallax tilts, dolly along the graph), glass panels sliding/expanding, light pulses travelling along edges, kinetic typography for key lines, crisp UI micro-interactions (hover, click ripple, ticks). Transitions are match-cuts through UI elements rather than hard cuts.

### SUPERS (ON-SCREEN TEXT)

Lower-left lower-third with TG Orange accent bar, Geist Medium. Every super from the script is placed as written.

### AUDIO

AI voiceover (samples sent for approval before final), premium licensed background music (modern tech / ambient pulse), UI SFX for clicks, ticks, whooshes, data pulses.

### BRAND COLOURS (FROM GUIDELINE)

| TG Blue | TG Orange | Black | Status only |
|---|---|---|---|
| #43A4DC | #EC6408 | #000000 | tick / gap flag |

### TYPOGRAPHY

**Geist Bold** headlines · **Medium** supers · Light body

Brand print font is Urbane. Geist (the brand's listed Office font) is used in these frames; we'll switch to Urbane in animation if a licence/font file is provided.

### LOGO

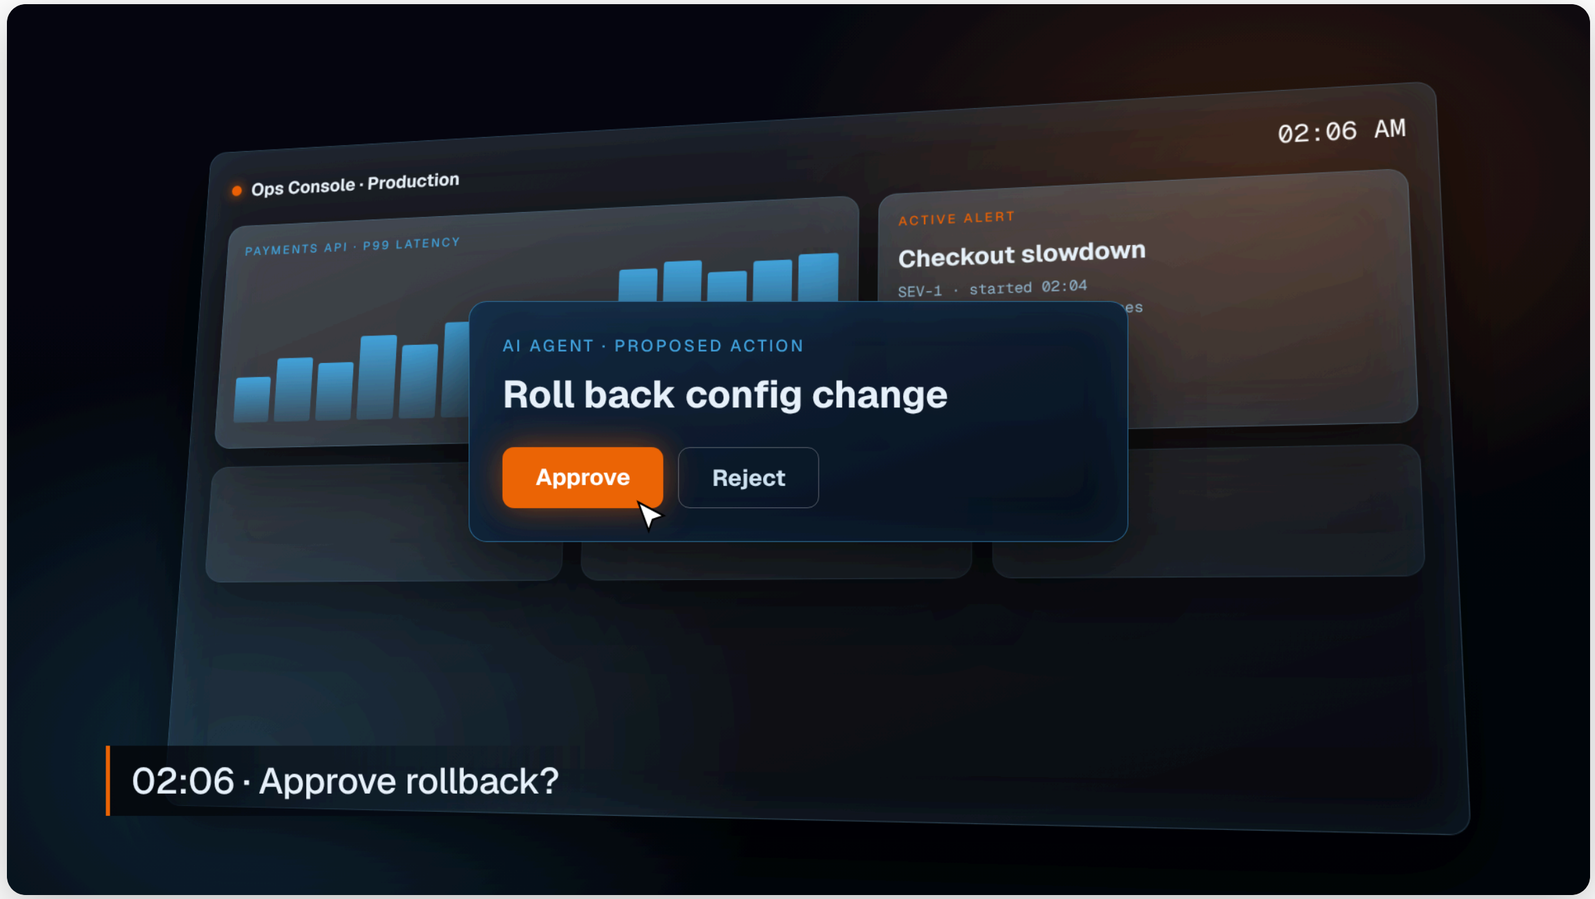

Alternate White logo on dark backgrounds, clear space = height of "e", never recoloured or distorted.

Timings are estimates from the script word count (~147 wpm) and will lock to the approved VO.

# 01

0:00 – 0:12 · 12s

**VOICEOVER**

If you're a developer, I've got a question for you… It's 2 a.m and your AI agent wants to roll back a change in production. Do you click approve?

**SUPER**

02:06 · Approve rollback?

**VISUAL**

Dark operations dashboard (same as video 2), 2:06 a.m. The agent's plan sits in an approval box: "Roll back config change." Cursor hovers over Approve.

**ANIMATION / MOTION**

Slow push-in on the tilted dashboard; latency bars pulse; clock ticks 02:05 → 02:06; approval box slides up with glass blur; cursor drifts in and hovers (button glow breathes).

# 02

0:12 – 0:20 · 8s

**VOICEOVER**

Most agents give you an answer and a "confidence score". But confidence isn't evidence. You can't audit a percentage.

**SUPER**

Confidence ≠ evidence

**VISUAL**

Close-up: the approval box shows only an answer and "Confidence: 92%".

**ANIMATION / MOTION**

Camera dives into the approval box; 92% counts up from 0; on "isn't evidence" a ≠ sign stamps between the words and the % flickers / hollows out.

# 03

0:20 – 0:24 · 4s

**VOICEOVER**

(music sting, no VO)

**SUPER**

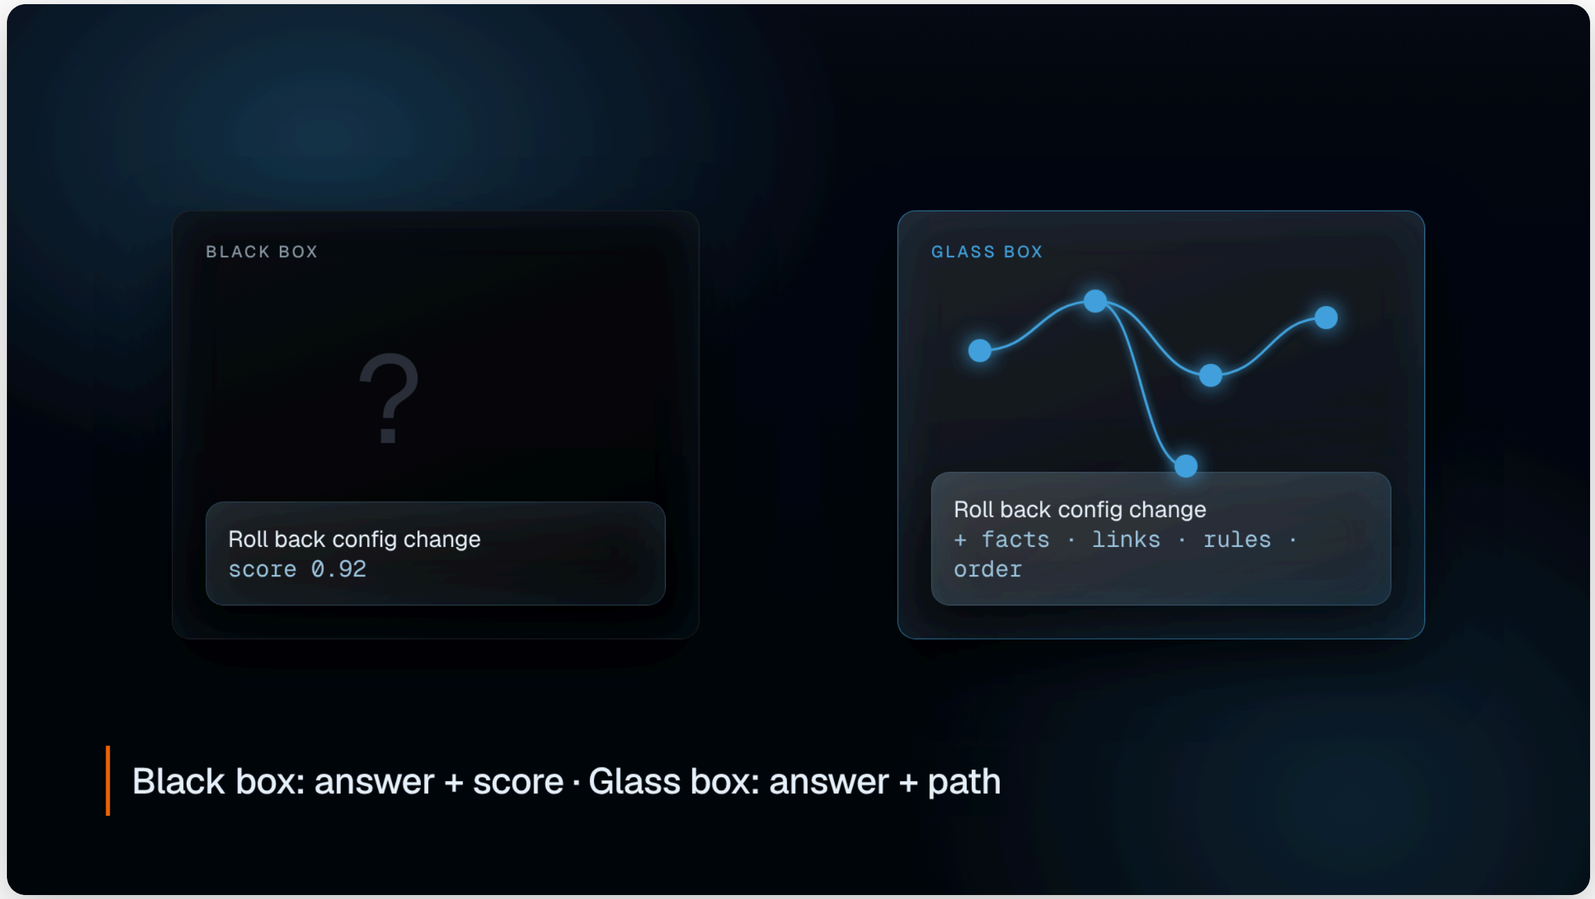

Can You Trust Your AI Agent with Multi-hop Decision-making Tasks?

**VISUAL**

Title card.

**ANIMATION / MOTION**

Glass panel sweeps in; title builds word by word (kinetic type, Geist Bold); a faint graph texture (brand texture) drifts behind; TigerGraph logo top-left.

# 04

0:24 – 0:44 · 20s

VOICEOVER

So what does it take for an agent to show its evidence? A black box gives you an answer, but a glass box gives you the answer AND the path behind it: which facts it used, how they connect, which rules it checked, and in what order.

SUPER

Black box: answer + score · Glass box: answer + path

VISUAL

Split screen. Left: a black box with an answer and a score. Right: a glass box with the answer plus a visible path of linked facts.

ANIMATION / MOTION

Two cubes/panels rise from the floor; left stays opaque; right turns to glass and the path lights node by node in sync with "facts… connect… rules… order".

# 05

0:44 – 0:48 · 4s

VOICEOVER

**The model predicts. And the graph proves.**

SUPER

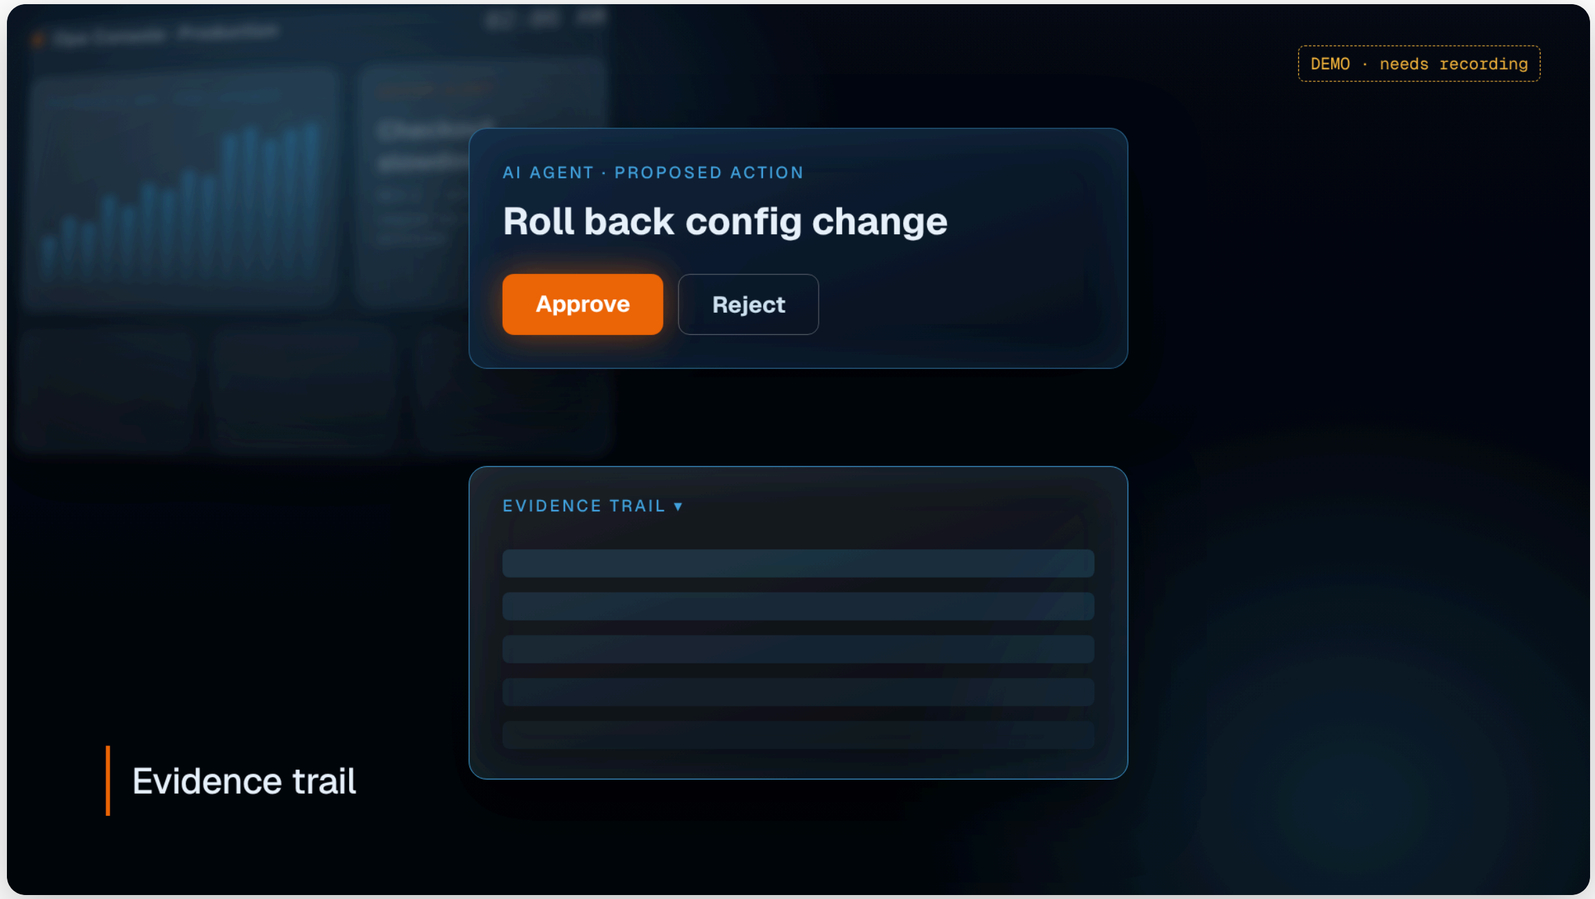

The model predicts. The graph proves.

VISUAL

The line resolves on screen.

ANIMATION / MOTION

Kinetic type: "The model predicts." types on in white; "The graph proves." assembles from graph nodes snapping into letterforms, orange underline swipe.

# 06

0:48 – 0:53 · 5s

VOICEOVER

Let's open the trail behind that rollback with this readiness checklist:

SUPER

Evidence trail

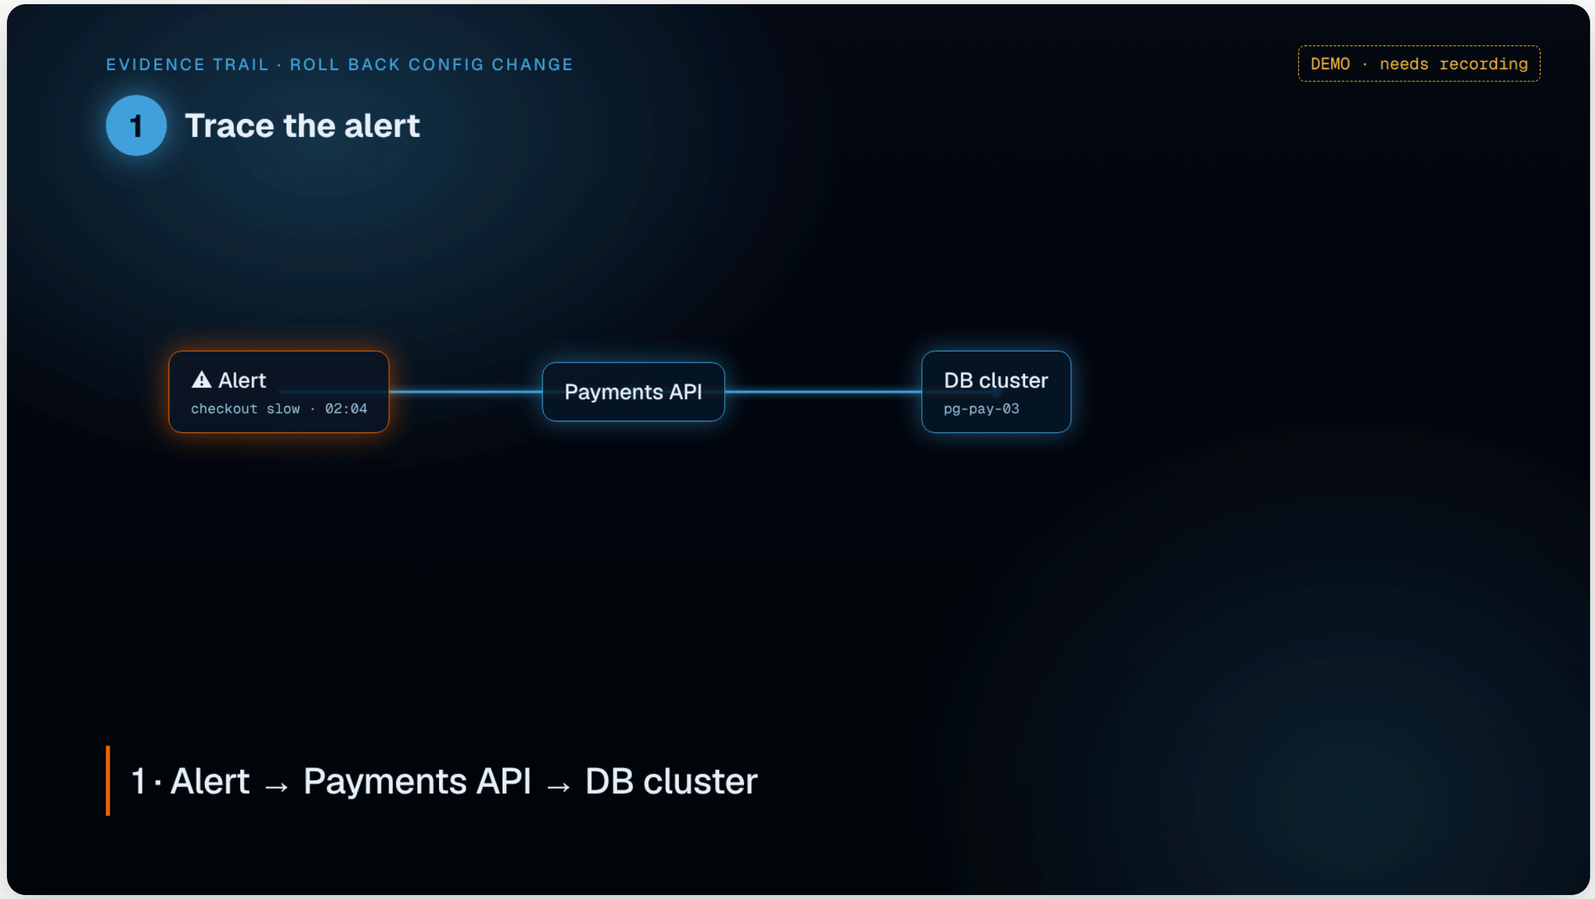

VISUAL

The approval box expands into an evidence trail.

ANIMATION / MOTION

Approval box splits open like a drawer; the dashboard falls back into depth of field; an empty node canvas unfolds with a scanning light line.

```
DEMO: frame shows our animated mock-up; swap/blend with real product recording if supplied
```

# 07

0:53 – 0:59 · 7s

## VOICEOVER

Step one: The alert traces to the Payments API, which depends on one database cluster.

## SUPER

1 · Alert → Payments API → DB cluster

## VISUAL

Step 1 lights up: Alert → Payments API → Database cluster.

## ANIMATION / MOTION

Alert node pulses orange; a light pulse travels along the edge to Payments API, then to DB cluster; each node pops with a soft scale-in (0.9 → 1).

DEMO: frame shows our animated mock-up; swap/blend with real product recording if supplied

# 08

0:59 – 1:10 · 11s

## VOICEOVER

Step two: That cluster had a configuration change at 1:44 am, twenty minutes before the slowdown began. Every fact carries its source and its timestamp.

## SUPER

2 · Config change, 1:44 a.m. · source + time on every fact

## VISUAL

Step 2: Config change #4471, applied 1:44 a.m., linked to the cluster. A timestamp and source tag sit beside it.

## ANIMATION / MOTION

Config node drops in above the cluster and links down; timestamp + source tags type on beside it; a mini timeline 01:44 → 02:04 ('20 min') draws under the graph.

`DEMO: frame shows our animated mock-up; swap/blend with real product recording if supplied`

# 09

1:10 – 1:20 · 10s

## VOICEOVER

Step three: The same cluster feeds checkout and refunds, and twelve premium customers are affected. Now that's an impact, not a guess.

## SUPER

3 · Checkout, Refunds · 12 premium accounts

## VISUAL

Step 3: the path branches to Checkout, Refunds and 12 premium accounts.

## ANIMATION / MOTION

Three branches fan out from the cluster; '12' counter ticks up on the premium node; affected nodes glow orange-rimmed.

`DEMO: frame shows our animated mock-up; swap/blend with real product recording if supplied`

# 10

1:20 – 1:34 · 14s

**VOICEOVER**

Step four: Before acting, this agent checked your rollback policy, which lives in the graph alongside the data. The change is under an hour old. Premium customers are at risk. The rule allows it.

**SUPER**

4 · Policy checked ✓

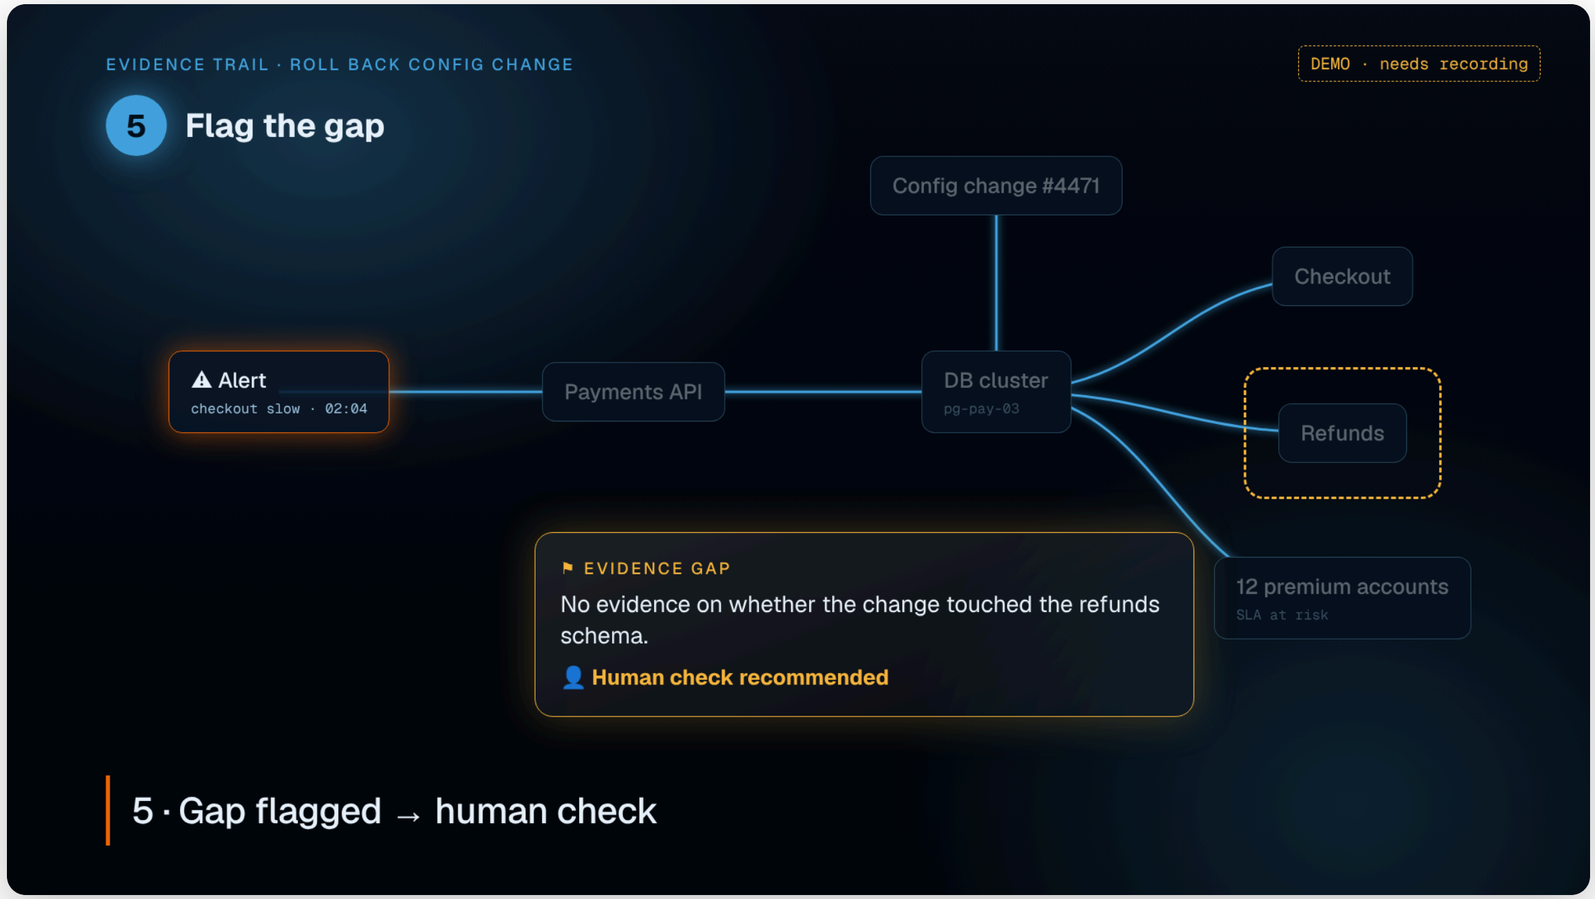

**VISUAL**

Step 4: a policy card attaches to the path: "Auto-rollback allowed when the change is under 1 hour old and premium SLAs are at risk." A green tick.

**ANIMATION / MOTION**

Policy card slides in and snaps onto the path with a connector; the two conditions tick one by one in sync with VO; final green tick stamps.

`DEMO: frame shows our animated mock-up; swap/blend with real product recording if supplied`

# 11

1:34 – 1:45 · 11s

## VOICEOVER

And step five: the agent says what it doesn't know. It found no evidence on the refunds data, so it asked a human to check.

## SUPER

5 · Gap flagged → human check

## VISUAL

Step 5: an amber flag: "No evidence on whether the change touched the refunds schema. Human check recommended."

## ANIMATION / MOTION

Refunds node flickers; a dashed amber ring and empty edge appear; the flag card unfolds; a small human icon fades in.

`DEMO: frame shows our animated mock-up; swap/blend with real product recording if supplied`

# 12

1:45 – 1:58 · 13s

VOICEOVER

Now you're not trusting a score. You're approving a decision you can read. And six months from now, when someone asks why, the same trail is still there to replay.

SUPER

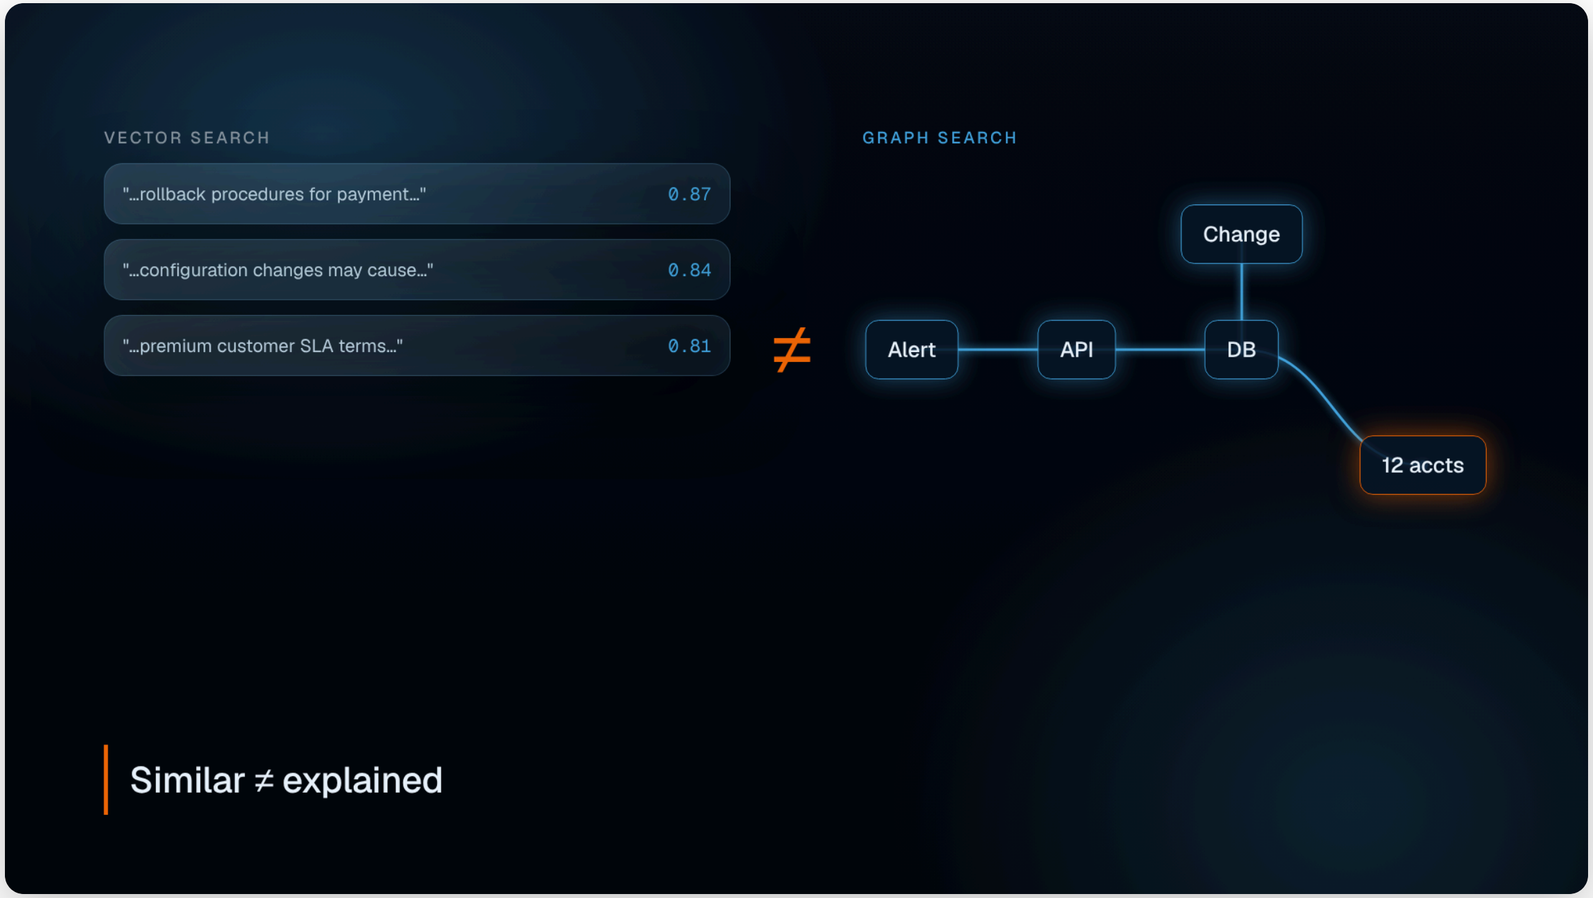

Approve with evidence · Replay it later

VISUAL

The full trail on screen; the cursor clicks Approve. Cut to a calendar flipping forward six months; an auditor opens the same trail, unchanged.

ANIMATION / MOTION

Click: button ripple + confirm chime, trail locks with a 'Signed 02:07' stamp. Whip to calendar pages flipping NOV → MAY; auditor window opens the same trail and a play ▶ scrubber replays it.

# 13

1:58 - 2:12 · 14s

**VOICEOVER**

You might ask, "why does this need a graph?" Because vector search can only tell you which passages looked similar to the question. It can't tell you why they matter to the decision.

**SUPER**

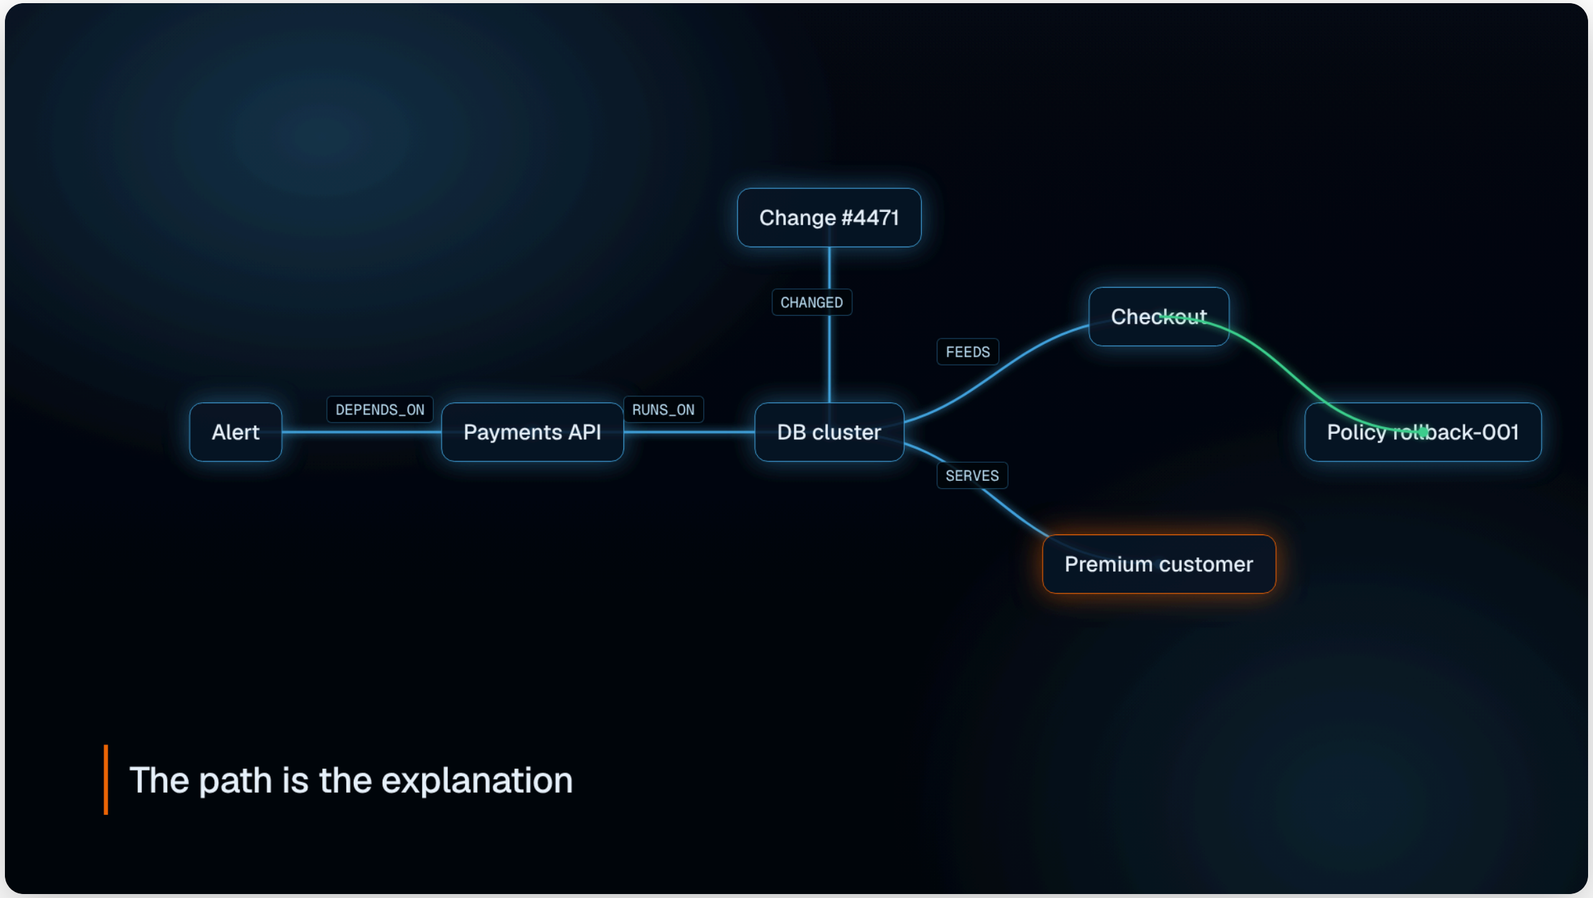

Similar ≠ explained

**VISUAL**

Split: a vector search result shows three text chunks and similarity scores. A graph result shows the connected path.

**ANIMATION / MOTION**

Left: chunks drop in as loose cards, scores count up, then drift apart (no links). Right: the demo path draws itself as one connected line. '≠' stamps in the centre.

# 14

2:12 – 2:25 · 13s

## VOICEOVER

In a graph search, the customers, systems, changes and rules are connected explicitly. So the path the agent followed is pretty clear. Nothing has to be reconstructed after the fact.

## SUPER

The path is the explanation

## VISUAL

The path from the demo, with each connection labelled.

## ANIMATION / MOTION

Camera tracks along the path left → right; each relationship label pops as the light pulse passes it; legend chips (customers · systems · changes · rules) fade in.

# 15

2:25 – 2:34 · 10s

## VOICEOVER

Your policies sit in the graph too, as guardrails. So when an agent refuses to act, it can explain that as well.

## SUPER

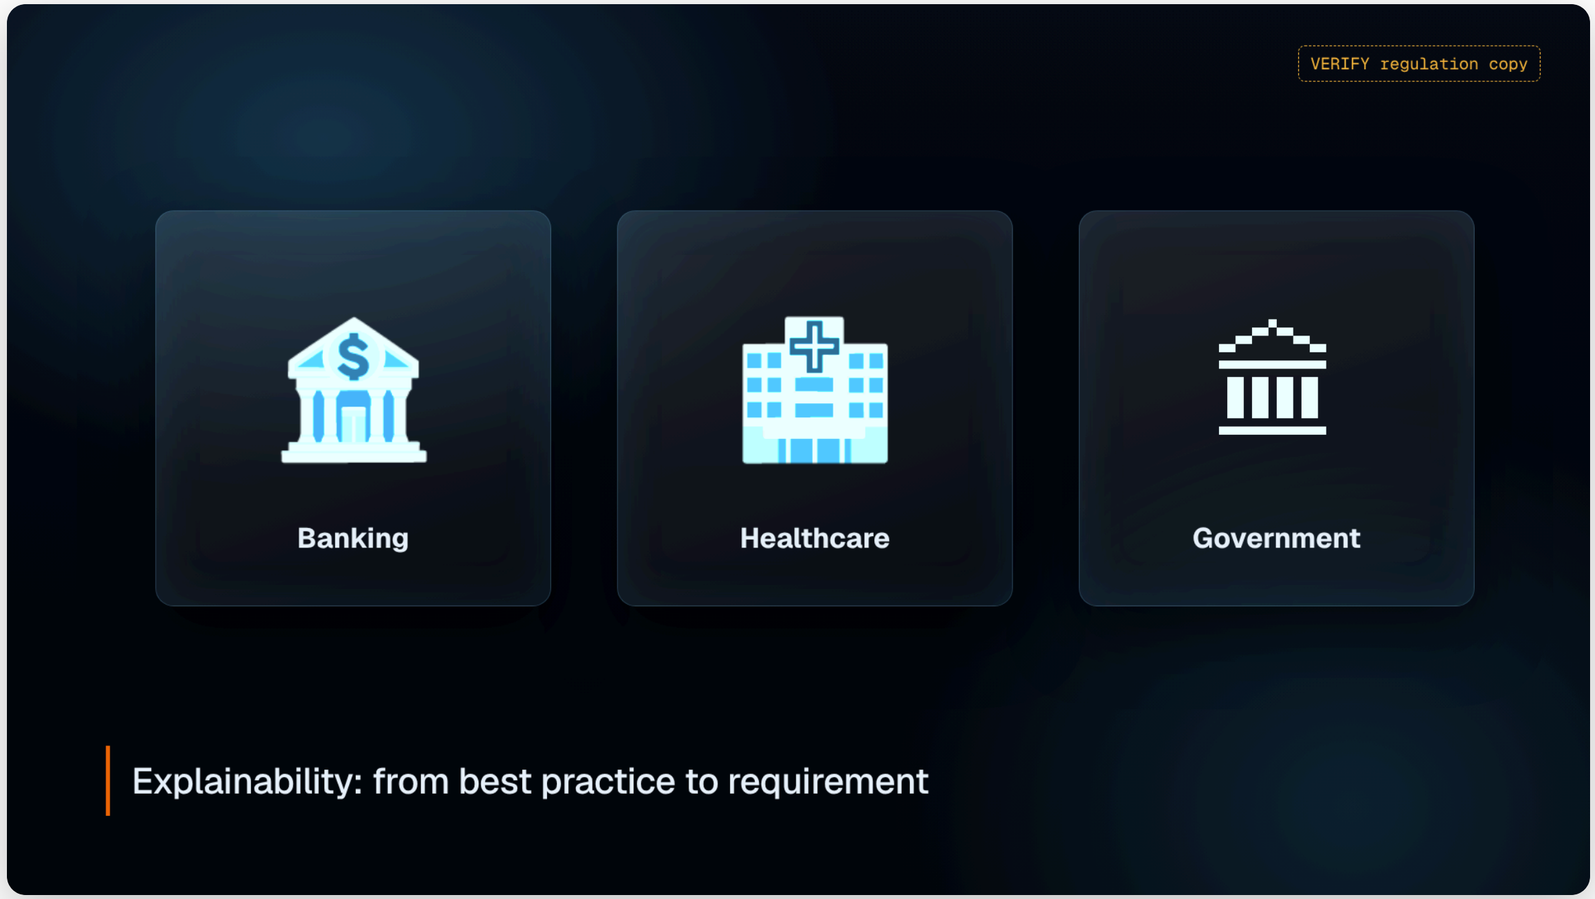

Guardrails with reasons

## VISUAL

Policy cards slot into the graph as guardrails; one blocks an action with a visible reason.

## ANIMATION / MOTION

Policy cards fly in and lock onto graph edges like rails; an action arrow hits one and bounces back; a red-orange 'Blocked' badge expands with its reason.

# 16

2:34 – 2:41 · 6s

VOICEOVER

And in regulated industries, explaining automated decisions is becoming a requirement, not a nice-to-have.

SUPER

Explainability: from best practice to requirement

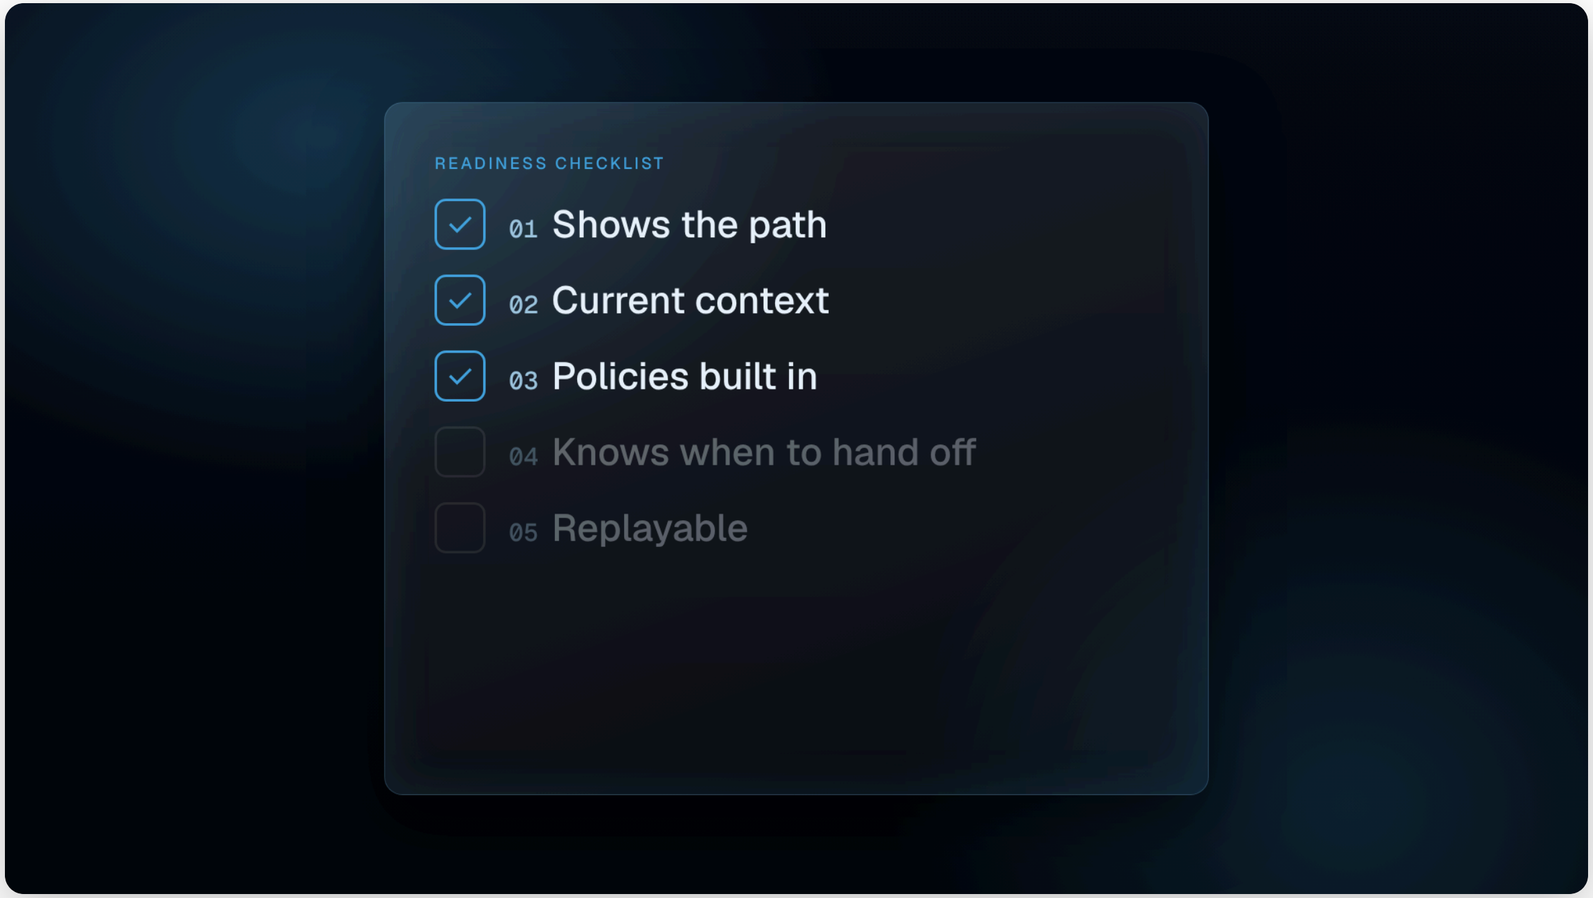

VISUAL

Short regulatory montage: a bank, a hospital, a government building.

ANIMATION / MOTION

Three line-art buildings (brand icon style, TG Blue + black) draw on in sequence, each with a small evidence trail card above; no specific regulation named until the client approves.

`VERIFY: client to approve any regulation named on screen`

# 17

2:41 – 2:46 · 6s

**VOICEOVER**

So before you trust an agent with multi-step decisions, run this checklist.

**SUPER**

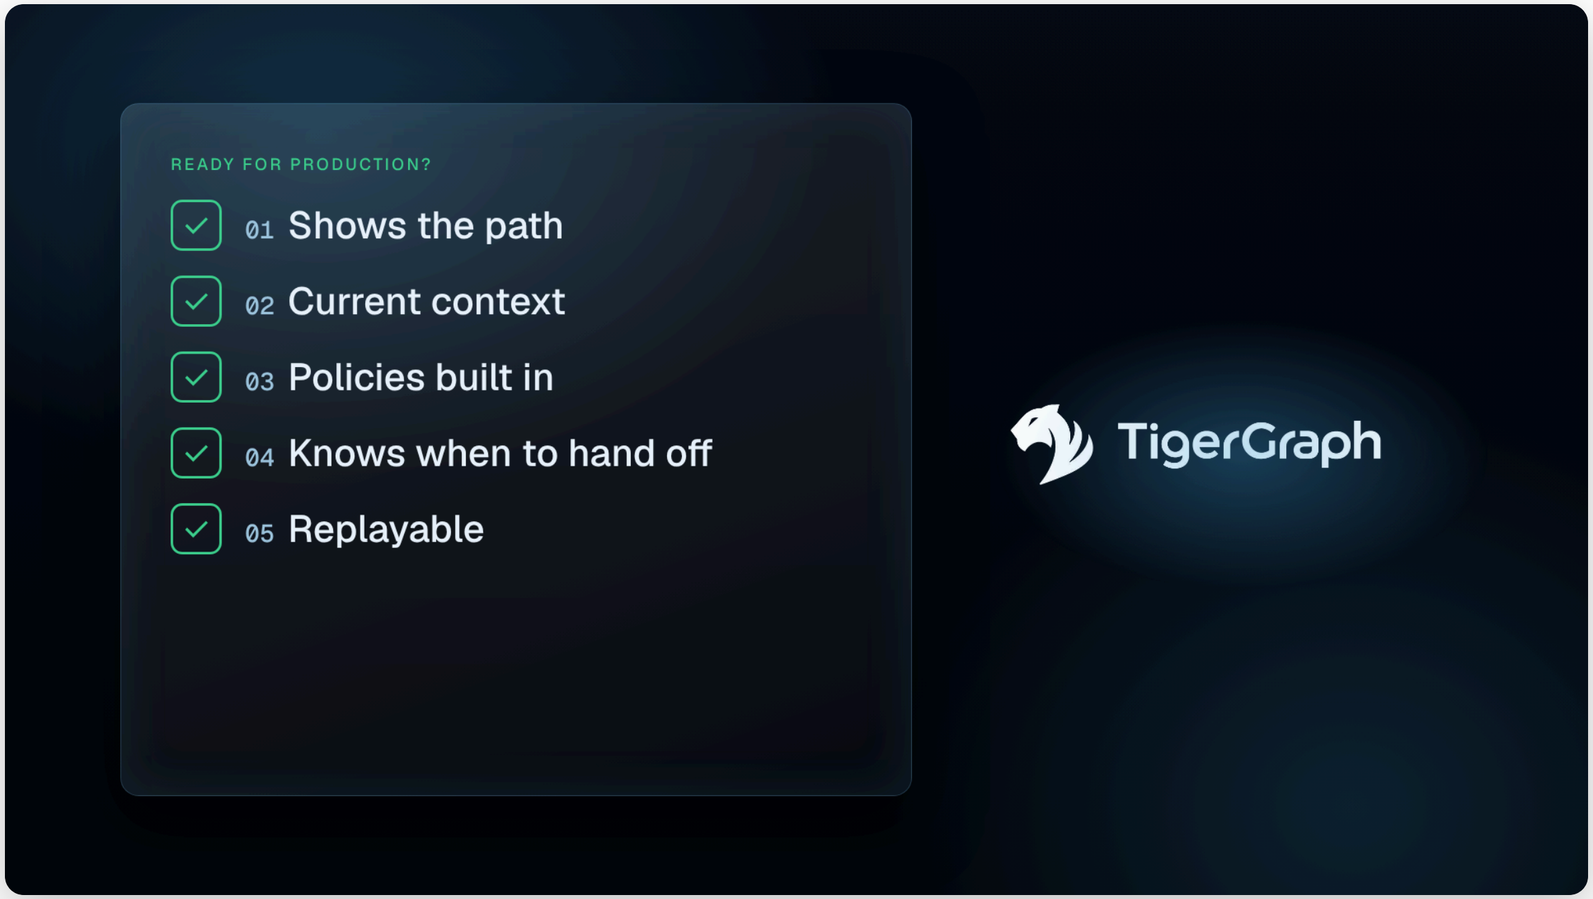

Readiness checklist

**VISUAL**

A five-item checklist builds, one line at a time.

**ANIMATION / MOTION**

Glass card; each line slides in with a tick-box drawing itself; ticks fill TG Blue as each is named (lines 1-5 timed to edit).

# 18

2:46 – 2:55 · 9s

**VOICEOVER**

If you can't tick all five, the agent isn't ready for production. But TigerGraph is built to tick them all.

**SUPER**

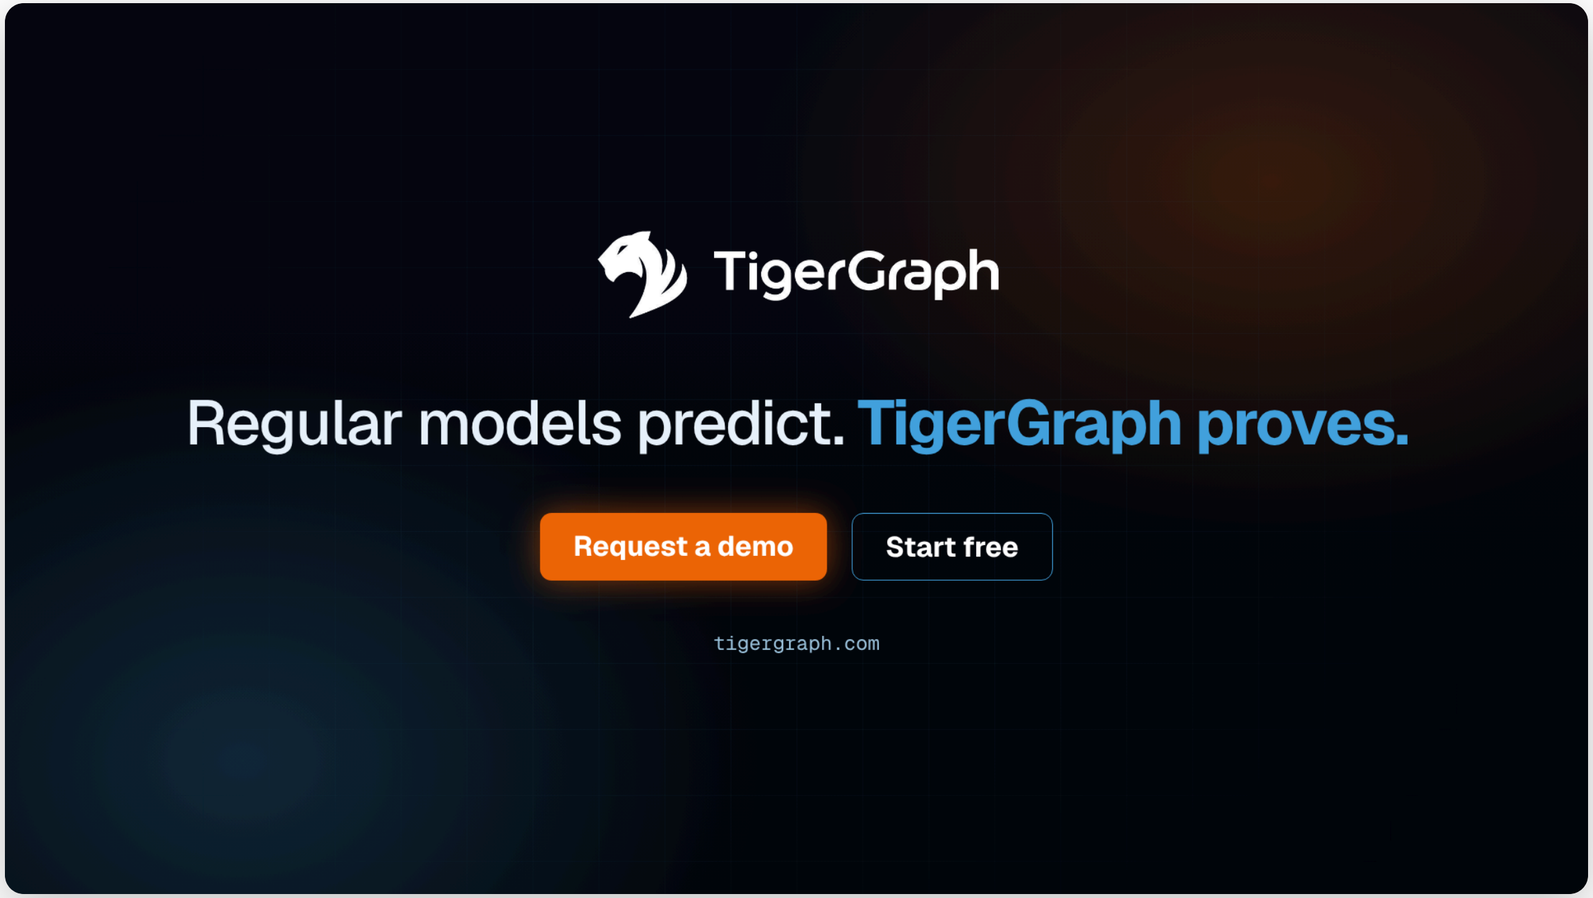

Ready for production?

**VISUAL**

All five ticks turn green over the TigerGraph logo.

**ANIMATION / MOTION**

All five ticks flip to green in a quick cascade; the card shrinks left and the TigerGraph logo resolves on the right with a soft blue bloom.

# 19

2:55 – 3:03 · 8s

VOICEOVER

AI predicts but Graph reveals the evidence.

SUPER

Regular models predict. TigerGraph proves.

VISUAL

End card. CTAs: Request a demo · Start free.

ANIMATION / MOTION

Logo holds centre; tagline fades up; two CTA buttons rise; subtle node texture drifts behind. Hold 4–5 s clean for end.

# Open points for the client

1. Demo footage (scenes 06–11): is there a product screen recording of the evidence trail? If not, we animate the trail as shown here.
2. Scene 01 continuity: please share video 2's dashboard design (or footage) so the 2 a.m. dashboard matches.
3. Scene 17: confirm whether any regulation is named on screen (currently none).
4. The script notes say no proof number was found; no statistic is used on screen.
5. Font: Urbane font files/licence, or approve Geist for the animation.
6. End card: confirm final line (VO "AI predicts but Graph reveals the evidence." vs super "Regular models predict. TigerGraph proves.") and CTA links.
